Faltron Free Memory

A very simple memory freeing tool that you can use for improving system performance. Some buggy applications do not release their allocated memory back to Windows and result in "memory leak", slowing down your system. Before you want to play a game or run a large application, you can use this tool to free up the memory and result in a slightly faster game or application performance. This tool also saves you the need to reboot when your system is low in resources after running too many applications or memory-intensive applications. This tool is simple for anyone to use; just click on the 'Free' button and wait for the freeing process to complete. The speed of the freeing process depends on the speed of your processor and the amount of free physical memory your system has. It also gives the real-time statistic of the amount of total, free and used memory. Unlike other similar tool, this program is freeware and does not contain any spyware/adware components. **Warning!** You should not use this tool on Windows XP and probably other NT-based system as it will deteriorate performance. It works well only on Windows ME.
